

Finding prime numbers by sifting

A **prime** is a number greater than 1 that cannot be formed by multiplying two smaller whole numbers. In other words, a prime can be divided into whole numbers only by itself and the number 1. For example, 5 is a prime because no numbers can be divided into it except for itself and 1. However, 6 is not a prime since it can be divided by 2 and 3.

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|-----|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 |
| 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 |
| 41 | 42 | 43 | 44 | 45 | 46 | 47 | 48 | 49 | 50 |
| 51 | 52 | 53 | 54 | 55 | 56 | 57 | 58 | 59 | 60 |
| 61 | 62 | 63 | 64 | 65 | 66 | 67 | 68 | 69 | 70 |
| 71 | 72 | 73 | 74 | 75 | 76 | 77 | 78 | 79 | 80 |
| 81 | 82 | 83 | 84 | 85 | 86 | 87 | 88 | 89 | 90 |
| 91 | 92 | 93 | 94 | 95 | 96 | 97 | 98 | 99 | 100 |

The ancient Greek mathematician Eratosthenes discovered a simple way to find all small primes using a “sieve” system. It does so by iteratively marking as composite (i.e., not prime) the multiples of each prime, starting with the first prime number 2. Try it by yourself on the table above.

- Cross out 1, which is not a prime.
- The next number is 2. Any number that can be produced by multiplying by 2 cannot be a prime. So, cross out all multiples of 2, except for 2 itself.
- The next is 3; cross out all multiples of 3, except for 3 itself.
- All multiples of 4 were already crossed out since they are also multiples of 2.
- Then cross out all multiples of 5 and 7, except for themselves.
- The remaining numbers not crossed out are all the primes below 100.
